

## Photoionization Detector (PID) Response Factor (RF) for various Volatile Organic Compounds (VOC).

### Scope of the document:

Correction of the VOC reading, using RF reference table, for known various VOCs measured with LEO meter VOC-MODULE.

Using this table, someone can calculate or even have the correct reading in ppb on the screen of LEO handheld meter for specific known gasses that are measured.

### VOC-MODULE

The VOC-MODULE measures the total VOC concentration of all gasses present in the sampled volume. Its sensor can measure all volatile compounds with ionization energy (IE) lower than 10.6 eV.

The PID VOC sensor inside the VOC MODULE has different sensitivity to different measured gasses.

LEO's PID sensor is calibrated using isobutylene as a reference gas, which means that the Response Factor for the isobutylene is 1.

The user can insert the Response Factor of any other gas, into LEO VOC-MODULE settings, in order to show this gas true value (see VOC-MODULE User Manual, section RF setting).

VOC-MODULE is factory calibrated using isobutylene in air (balance). Therefore, the measured values will be expressed as the equivalent signal level of this reference. Calibration with different reference gas or even different balance gas will result in shift of readings.

### PRECAUTIONS:

- High humidity in the measured gas will result to inaccurate readings.

### GENERAL CONSIDERATIONS:

As good practice, it is recommended to have LEO charged before use, and not to charge it during use.

Follow the instructions written in LEO handheld meter and VOC-MODULE manuals, for

- The correct use of the instrument
- Calibration and Zero Reset of the VOC-MODULE

**VOC Displayed value:**

The VOC-MODULE displayed value is the total value for all gasses measured at the time.

This value will be:  $\text{Reading (ppb)} = 1 / [\text{gas(a)}/\text{RF(a)} + \text{gas(b)}/\text{RF(b)} + \text{gas(c)}/\text{RF(c)} \dots]$

To get the correct value of a gas other than isobutylene, without changing the RF setting, you could multiply the value measured, times the RF of the measured gas type.

For example for a gas with RF=0.56, use this formula:  $\text{True Value} = \text{Reading (ppb)} * 0.56$

**KRYPTON PID LAMP 10.6 EV RF TABLE:**

Xylidine, all		C8H11N	1300-73-8	7,5	0,7	

**Notes:**

**S:** slow. PID requires at least 30s for stable response.

**V:** variable response. The response is susceptible to small changes in ambient conditions, particularly humidity.

**X:** temporal contaminating. PID responsivity may be suppressed for at least 30min after 100ppm-min exposure.

**W!:** expected to cause PID lamp window fouling. May require regular bump tests and window cleaning.
